

SMARTBRIDGE

Let's Bridge the Gap | SKILL WALLET - A SmartBridge Product

Date	29-09-2026
Team ID	SWTID-2026-7949
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value

Empathy Map

Create an empathy map to understand your customer/user from four perspectives - what they Say, Think, Do, and Feel - in relation to the problem your project addresses. This helps the team build a customer-centric solution.

Target Persona: Departmental Faculty / Academic Staff (Branch: EEE) & ServiceNow Security Administrator

SAYS (What they explicitly state)	DOES (Actions & Behaviors)
• "I should only have access to records and student profiles belonging to my specific branch (EEE)." • "Other department data (CSE, ECE) should remain confidential and completely restricted from our view." • "I need permission to create, update, and manage student information within my branch seamlessly without security errors." • "Administrators must be able to audit and oversee all records globally across all branches."	• Logs into ServiceNow instance using assigned credentials with specific branch role (bb1, bb2, bb3, bb4). • Navigates to custom table (u_institution_details) to query student roll numbers, contact info, and faculty mappings. • Attempts to create new student records and update branch records when granted write/create privileges. • Verifies that cross-branch queries return "No records to display" to maintain strict institutional data governance.
PERSONA: EEE Branch User / Department Coordinator & Security Admin (Role bb1: Read Role bb2: Create Role bb3: Write Role bb4: Delete Admin: Global)	
THINKS (Internal thoughts & beliefs)	FEELS (Emotions & Concerns)
• "Standard UI policies or client scripts are easily bypassed via APIs/reports; server-side Script-Controlled ACLs are mandatory." • "Field-value evaluation (Branch == 'EEE') combined with role verification (gs.hasRole) ensures true zero-trust data segregation." • "Granular control over CRUD operations prevents accidental record deletions or unauthorized branch	• Confident knowing departmental student data (emails, phone numbers, roll numbers) cannot leak to unauthorized users. • Frustrated when default out-of-the-box ServiceNow ACLs allow wider visibility than institutional policy permits. • Reassured by clear security boundaries where each role (bb1 to bb4) corresponds strictly to legitimate

edits."

- "Is our security architecture scalable if we introduce 10+ new academic departments in the future?"

business needs.

- Empowered having dedicated administrative control without compromising row-level security integrity.
