

SMARTBRIDGE

Let's Bridge the Gap | SKILL WALLET - A SmartBridge Product

Date	29-09-2026
Team ID	SWTID-2026-7949
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value

Communication Plan

Effective communication is essential for a successful project demonstration. This document outlines the communication strategy used within the team and with stakeholders throughout the project lifecycle, including how updates, issues, and feedback were managed.

Communication Plan:

S.No	Communication Type	Frequency	Channel / Tool	Participants	Purpose
1	Team Standup	Daily	Microsoft Teams / Discord	All Team Members	Review daily ACL implementation milestones, role creations, and unblock dependencies.
2	Progress Update	Weekly	Slack / Email Status Report	Team Members & Project Mentor	Track sprint deliverables, update set commit readiness, and assess milestone timelines.
3	Issue / Bug Discussion	As Needed	Jira / Teams Call & Screen Share	Developers & System Security Admin	Debug server-side ACL script evaluation errors, security admin elevation, and role mappings.
4	Stakeholder Review	Bi-Weekly	Zoom / Google Meet Demonstration	Team Lead, Mentor & Evaluator	Present verified live demonstrations of row-level access restriction for EEE branch vs admin.
5	Final Demo Rehearsal	Once	ServiceNow PDI Live Walkthrough	All Team Members	Conduct dry run of multi-persona impersonation walkthrough, timing, and Q&A presentation.
6	Retrospective Meeting	End of Sprint	Miro Board / Google Meet	Project Team	Evaluate completed milestones, document lessons learned, and finalize Word document submissions.

Communication Challenges & Resolutions:

S.No	Challenge Faced	Resolution / Action Taken
1	Initial ambiguity regarding whether client-side UI policies or server-side ACLs were preferred for restricting record visibility across academic branches.	Conducted a technical review session with project mentor; confirmed that server-side Script-Controlled ACLs are mandatory to prevent unauthorized data exposure via REST APIs and URL tampering.

2	Discrepancy in testing results when team members tested roles due to uncommitted update sets in individual personal developer instances (PDIs).	Established a strict single-source configuration protocol: packaged all table definitions, custom roles (bb1-bb4), and ACL rules into update set 'ACL Project [Global]' and shared XML exports across instances.
3	Confusion during user impersonation testing regarding browser session caching causing stale role permissions to persist.	Documented clear testing guidelines in team Slack channel advising members to use incognito/private browser windows and verify elevated 'security_admin' privileges before testing ACL modifications.
